1 Introduction²

The Pegida Protest Action Database (PEGPAD) contains information about protest activities by the larger Pegida movement and its local branches as well as protest activities by counter-movements and Pegida opponents in 89 major German cities. The database covers events that occurred between October 2014 and December 2017. It is not limited to street protest but also includes different protest tactics such as sit-ins and candlelight vigils. The PEGPAD is based on media reports and records the exact timing and location of the events and information about actors, slogans, violence and police interventions.

2 Sample of German Cities

The database records protest events in 89 German cities. The sample of cities (see Table 1 for a list of all cities included in the database) comprises all current and some former major cities ("Großstädte"). In order to qualify as a major city, more than 100,000 inhabitants are required.

¹Please note that the data used in this article differs slightly from V1.1.

²The structure of this codebook was inspired by Rød and Weidmann (2014).

3 Selection of Media Sources

In order to obtain information about protest and counterprotest activities, we rely on regional newspaper articles recorded in the online database GBI-Genios wiso (<https://www.wiso-net.de>). The database provides access to digital articles from 91 regional and local newspapers. We provide the full list of outlets in Table 2. For every city, we automatically retrieved all articles resulting from entering the following search string: "[city] AND pegida AND (demo* OR protest* OR *demo OR *protest)". Duplicate entries were deleted from the result list based on text similarity and the final set of articles was handed over to research assistants for manual coding.

4 Unit of Analysis: Event Report

The database consists of event reports. Each row represents a protest event by either Pegida followers or their opponents, as reported in one of the media outlets. There can be multiple reports about a single event and one news article can produce several event reports. Each report contains information about the city where the event occurred and the exact date. If multiple clearly distinguishable events occurred in the same city on the same day, they are treated as separate events. For a discussion of the advantages of this approach, see Weidmann and Rød (2015).

5 Definition of a Protest Action Event

The database contains all observable collective activities to publicly support or oppose the Pegida movement itself or its goals within clearly identifiable spatial and temporal boundaries.

1. There was an actual, observable protest action; we do not code intentions to organize protest actions.
2. The activity was carried out by a group of people or by individuals in the name of an organization. We do not code interview statements or verbal acts of protest.
3. The activity is explicitly related to the wider Pegida movement. We do not code demonstrations exclusively by AfD supporters or opponents.
4. The action occurred in public. We do not code protest actions that occurred in private spaces during meetings of organizations.
5. We do not code protest actions such as a performance series or festivals that occur over multiple days.

6 Variables

6.1 Values and Labels

In the following, we list all variables included in the PEGPAD and the values they can take. In general, we code missing values if the event reports do not contain the relevant piece of information. This NA rule applies to all variables except the ones listed as "general event information". In order to qualify as an event, information for these variables is needed. Variables that require text input can be left empty if no information is available.

All variables with text input (such as *organizations* see below) should be entered with alphanumeric characters only (no special characters) unless explicitly stated otherwise. Exceptions include the separator (;) for multiple entries. There should be no whitespace after the separators.

6.2 General report information

Report ID (`report_id`, numeric)

Unique identifier for event reports.

Coder ID (`coder_id`, character)

This variable identifies the research assistant who filed the event report.

Article ID (`article_id`, character)

This variable includes identifying information about the article that contains the event report. This information is needed to link the article's source text and the event report. Due to copyright reasons, we cannot include the source text in the data.

6.3 General event information (required information)

City (`city`, character)

This variable includes the name of the city. All cities included in the database are listed in Table 1.

Event date (`event_date`, date)

This variable shows the exact event date. We ensure not to confound the article's publication day and event date. If we cannot clearly identify the event date, we do not code the event. If no date is given, we enter the article's publication date. We do not code announcements of protest activities.

Side (`side`, character)

Indicates whether the protest activity supported (pro-pegida) or opposed (anti-pegida) the Pegida movement.

Tactics (`tactics`, character)

What kind of protest activity was conducted?

We list all tactics that were used during the event, separated by a semicolon. We use the word "demonstration" for all kinds of street protests and actions during a street demonstration.

6.4 Participant Variables

Participants (`participants`, character)

Who were the actors participating in the protest action?

We separate them by a semicolon if more than one actor is given in the article. We list all names of involved organizations and descriptions of social groups. We use capital letters to indicate proper

names. Proper names are in German; unspecified actors such as unions or student associations are in English.

We tried to be as precise as possible when listing the groups of participants. We only include information about participants if it is informative with regard to the social background of the group, i.e. we do not code "demonstrators".

Number of participants (num_participants, numeric)

Information about the number of participants as provided in the news article. The input could be both an exact *number* or a *phrase* such as "several hundreds". If the article describes the number of participants as **around / more than** 100, we code this as 100. For the published dataset, we translate phrases into numbers. Moreover, if the article reports more than one estimate, we separate them by a semicolon (;). If a range of participants is given, we use the lowest estimate, e.g. we code "between 200 and 400" as "200".

Violence by participants (part_violence, numeric)

Did protest participants use violent means? If yes, what kind of violence? If it is unclear who is responsible for the violence, code the described levels of violence for both parties (e.g. police and demonstrators).

- NA = no information
- 0 = explicit report of nonviolence;
- 1 = property damages;
- 2 = physical attacks against police forces;
- 3 = physical attacks against counter-demonstrators/Pegida supporters;
- 4 = attacks against both police and counter-demonstrators

6.5 Police Variables

Level of police engagement (police_eng, numeric)

How did the police react to the protest activity? If it is unclear who is responsible for the violence, code the described levels of violence for both parties (e.g. police and demonstrators).

- NA = no information or no presence;
- 0 = passive role/presence;
- 1 = low-level interventions (e.g. Platzverweise);
- 2 = physical interventions (e.g. arrests)

6.6 Further Event Variables

End of activity (end_activity, numeric)

Did the protest action end according to the initial plan?

- NA = no information;

- 0 = explicit report of regular termination;
- 1 = activity was disturbed but completed;
- 2 = activity was ended before schedule

Cause of disturbance (dist_cause, character)

What was the cause for disturbances of the protest action? Text input, e.g. police dispersal, weather, counter-demonstrators

Slogans (slogans, character)

We list slogans chanted by protest participants if they are directly quoted in the news report, separated by a semicolon.
